Response to Arguments

Applicants arguments regarding the claim rejections - 35 USC § 112, are not persuasive since no amendment specifying the actual process steps have been set forth. The mere recitation of the polyimide in the form of a membrane does not overcome or fully address the rejection.

Claim Rejections - 35 USC § 112

Claims 1,3-5,7-15,17-28 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

The recited process steps remain unclear in as much as the recited "exposing said polyimide" does not set forth the actual steps and parameters necessary to accomplish that process.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1,3-5,7-15,17-28 are rejected under 35 U.S.C. 102(b,) as being anticipated by WO 99/40996 see abstract, and pages 17-33.

The reference discloses a process for preparing a selective composite membrane, having many practical applications, comprises synthetically impregnating at least some pores, of the upper layer containing the relatively

smaller pores, in an asymmetric base membrane, with a filling material comprising an ordered macromolecular structure, by applying under superatmospheric pressure to the asymmetric base membrane, a solution of reactants adapted to interact with the formation of covalent bonds in the ordered macromolecular structure, wherein the dilution of said reactants is sufficiently low, and the pressure is sufficiently high and of such duration, so that formation of covalent bonds is initiated in pores of the upper layer as microreaction vessels and progresses within the pores of the upper layer, the reaction forming such covalent bonds being quenched at any desired stage.

The reference discloses a process prepared from the same components as claimed by applicants and within the temperature parameters as claimed as well as the limitations as claimed. In view of the above, there appears to be no significant difference between the reference and that which is claimed by applicant(s). Any differences not specifically mentioned appear to be conventional. Consequently, the claimed invention cannot be deemed as novel and accordingly is unpatentable.
